

## Reflector Material

### Highly polished anodised aluminium reflectors

This highly polished anodised UV reflector material is optimized for the reflection of the UV spectrum. It comes coated with a protective coloured “peel off” coating which must be removed before use. This material is available in sheets or can be cut and shaped to customer requirements. For this a drawing must be provided which includes dimensions, thickness, material (if different to Aluminium) and radius if curved. Standard material thickness is available in 0,5 , 0,7 and 1,0 mm.
