

Warranty for electronic power supplies

Any warranty of uv-technik international assumes the intended use of the electronic power supply (EPS) according to the current valid operating manual. This requires in particular that the EPS does not become unusable by disturbances from the supply net (overvoltage, lightning, disturbances) or other external influences, such as dirt or moisture. The warranty also requires that the EPS are installed and operated as prescribed and not exposed to shocks, impacts, vibrations or high temperatures. The provision for the intended use is described in the operating instructions for electronic ballast that can be found at www.uv-technik.co.uk.

Faulty electronic ballasts which were operated under the intended use are repaired or replaced free of charge by uv-technik international within 2 years from delivery date. The basis for the verification of the delivery date is the label which is adhered to the EPS. This must remain legible and must not be removed.

The warranty is only valid if matching lamps from our range are used or the lamps have been approved by uv-technik international.

The warranty is void if damage is caused by external interference into the electronic ballast. The security safety seals adhered to the EPS to prevent the opening of the device must be intact.

In addition, the terms and conditions of uv-technik international apply.
